

# HERD IMPROVEMENT

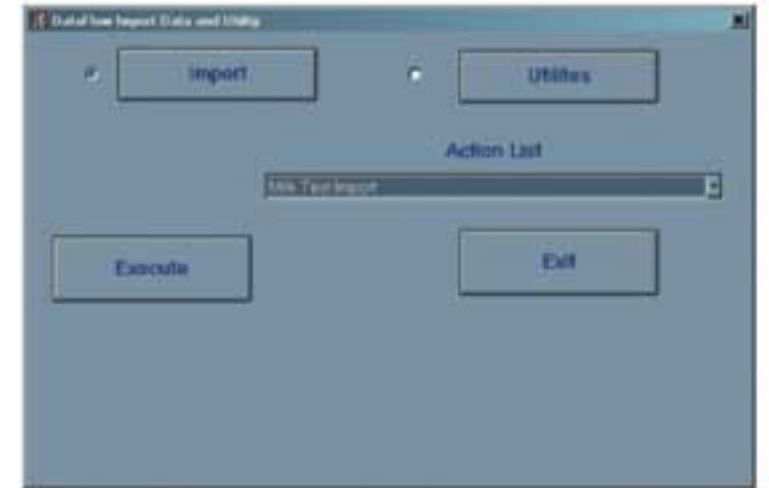

## NATIONAL LIVESTOCK DATABASE

iDATAFLOW has the option to connect directly to approved National Livestock Database administrators. Data can be uploaded and downloaded to save double entries and keep livestock records current.

## IMPORTING / EXPORTING UTILITY

iDATAFLOW has the ability to import and export data to speed up manual processes. Some of the utility options are:

- Milk test data
- Collar ID numbers
- RFID tags
- Data from a PDA

## HERD TESTING

The results from your herd test can be imported into the system for analysis. Yield, fat, protein, somatic cell count and lactose are recorded in the cow card and can be reported using the report editor. The fat and protein records from the herd test can be used to calculate a Fat and Protein Corrected Milk Value (FPCM) of the cow. Depending on how you are paid for your milk, this corrected value can be used when evaluating the production value of the cow in the herd.
