

iNTELJET

The iNTELJET system consists of an electronic timer, collection vessel and air injector valve. The assembly is connected to the end of the 4" milking line. During washing, water is drawn into the collection vessel from the jetter line. Periodically the injector valve is opened which propels the washing solution from the collector down the milking line to the milk receiver. As the solution is propelled down the milking line, a slug is formed which scrubs the milking line for maximum plant hygiene. The slug creates added turbulence in the receiver ensuring a thorough clean. The iNTELJET is Interactive capable. This unit is automatically initiated in Wash Mode if installed with other Interactive units such as the iNTELPUMP, iNTELFLOW or iNTELWASH.

KEY FEATURES

- Suits 4" Milk lines
- Cleans line with washing slug
- Interactive Capable
- 100mm or 150mm diameter collection vessel
